NIPPON STEEL has produced and sold a complete range of steel products and has served every need in Japan and overseas for over a long period of time as a comprehensive steel manufacturer.

In the pipe & tube unit, we have the latest production facilities that can cover all products, such as those involving seamless rolling, electric resistance welding, butt welding, and arc welding, as well as a product control system based on non-destructive inspection using computers.

In addition, the comprehensive unique capabilities of NIPPON STEEL include application technologies and construction technologies varying from high-grade pipes for lines, oil wells, and power generation, etc., to general pipes & tubes such as those for piping and structures. We believe that such technologies will serve you and your needs.

We would like to gain your interest in the pipe & tube products of NIPPON STEEL.

Applications

Pipes & tubes for piping

- Inter city pipeline
- Various pipes in condominiums: ELP®-NTA (gas, water supply, water drain, hot water supply, etc.)
- Regional cooling conduit
- Offshore pipeline: NS-PEL® (green)
- Flare joints of equipment pipes in buildings

Pipes & tubes for mechanical structures

- Pipes & tubes for automobiles
- Printing roll
- Vibration-absorbing cylinder
- Pipes & tubes for construction machines (cylinder, bushings)
- Pipes & tubes for construction machines (crane booms, lattices)
Pipes & tubes for marine structures and general structures

- Pipe & tube columns for high-rise buildings
- Torii
- Offshore platform
- Transmission tower
- Dimple pipe for solar panel stand
- Lighting pole (tapered pipes & tubes)
- Stadium roof
- Truss roof
- Road bridge post
Pipe piles/pipe sheet piles

Pipe piles for earth-retaining structures
Pipe sheet piles for earth-retaining structures
Pipe piles for large offshore platforms
Heavy-duty coating pipe pile

Pipe piles for large offshore platforms

Pipes & tubes for plants

Geothermal steam pipe
In-plant gas piping
LNG pipe

LNG pipe
Petrochemical plant pipe

Pipes & tubes for shipbuilding

Marine steel pipes
Ship’s piping
Pipes & tubes for boilers/heat exchangers

Appearance of thermal power generation boilers
Superheater tubes and main steam pipes
Inside view of a thermal power generation boiler under construction
Boiler tubes

Pipes & tubes for high pressure hydrogen

Product sample
Hydrogen station piping

Pipes & tubes for the chemical industry/nuclear power plant

Nuclear power plant
Stick elbow
Heat exchanger tubes for steam generators (SG)
Hollow piston
Oil & Gas Casing & Tubing/Line pipe (offshore)

- Offshore line pipes for receiving crude oil
- Seabed oil/gas production equipment
- Offshore production well
- Installation of a pipeline
- Offshore platform
- Casing
Production process  Seamless pipes & tubes (Mannesmann process)

- **Hot process**
  - **Mandrel mill process**
    After heating the round steel billet, hollow pipes are made with a piercer with toe angle. Then, elongating rolling is performed by a mandrel mill, which consists of a multi-step continuous rolling machine, to thereby produce the mother pipe. This mother pipe is reheated and is then finished by stretch reducing mill to a specified outside diameter and thickness for the final product.
  - **Plug mill process**
    After heating the round steel billet, hollow pipes are made with a piercer. Then, elongating rolling is performed through a plug mill. Pipes are reeled and finished to a specified diameter for final products. For a pipe & tube with a small diameter, original pipes with a specified diameter are reheated and then finished to the specified outside diameter and thickness through a reducing mill for the final product.
  - **Cold-rolling process**
    When higher dimensional accuracy and mechanical properties are required compared to pipes produced by the hot-rolling process, cold drawing subsequent to hot rolling is performed for the final product.

- **Cold-rolled products**
Seamless pipe pipes & tubes (hot extrusion - hot hollow forged)

**Hot extrusion process**
(Ugine-Sejournet process)

Hot extrusion is a process in which heated billets are inserted into the cylinder, known as a “container,” and extruded with a hydraulic press. The specified outside diameter and thickness can be obtained with a die and mandrel. For pipes requiring higher dimensional accuracy and a surface finish, they are finished through cold rolling for the final product. With this process, fin pipes & tubes or various shaped steel other than steel pipes & tubes can be produced.

**Hot hollow forging process**
(Ehrhardt Push Bench process)

Hot forging is a process for producing large-diameter thick pipes that are used in severe environments, such as main steam pipes at power plants.
Electric resistance-welded pipes & tubes

Electric resistance-welded pipes & tubes are produced by forming the coil into a cylindrical form with top/bottom and left/right forming rolls while continuously rewinding the coil to be electric resistance welded. For a hot-finish electric resistance-welded pipe & tube (SR pipe), a long-size electric resistance welded pipe & tube is heated in a continuous heating furnace and drawn and finished by a stretch reducer. It is used to produce small-diameter pipes. Furthermore, NIPPON STEEL produces PIC (Pipe in Coil) in which the pipe is formed into a coil as a long-size pipe, in particular. Heat exchanger tubes by cold drawing are also produced.
Hot electric resistance-welded (SW) pipes & tubes are produced by electric resistant welding the heated coil and finishing it to a specified size with a reducing mill.
Arc-welded pipes & tubes

■ SAWL pipe (by UOE process)

UOE pipes are produced by forming the both ends of the plate into a groove, forming the groove-shaped steel into a cylindrical shape with a U press and O press, and then arc welding the linear joints from the inside and outside (SAW Submerged Arc Welding).

■ SAWL pipe (by Bending roll process)

Bending rolled pipes have two processes: A press bend process for finishing pipes & tubes into a cylindrical shape with a forming press and a bending roll process to firstly make a circular shape at both edges of the steel sheet with a bend press, and then to make a perfect cylinder shape by rolling. The linear joints of a formed shape are arc welded (submerged arc welding) from the inside and outside.

■ SAWH pipe (by Spiral process)

Spiral welded pipes are produced by bending and forming a coil into a spiral with a forming roll while continuously rewinding the coil, and by welding the joints from the inside and outside.
Secondary machining

NIPPON STEEL performs various secondary machining on the produced pipes & tubes according to the order specifications or applications.

### Pipes & tubes for piping
- Internal/External coatings
  - Internal coatings with epoxy paints, powdered polyethylene, unplasticized polyvinyl chloride, etc.
  - External coatings with 3-layer polyethylene, 3-layer polypropylene, fusion bonded epoxy, polyurethane, various paints, etc.
- Threading
- Bevel machining
- Joint machining
- Production of irregular shape pipes

### Pipes & tubes for boilers and heat exchangers
- U bending, aluminum plating, rifle machining, drawing

### Remarks
We will introduce companies for swaging, expanding, bending, cutting to length, etc.
